

Chapter 19

1. Determine which of the following is an FQDN and which is a PQDN:

a. xxx->PQDN

b. xxx.yyy. ->FQDN

c. xxx.yyy.net ->PQDN

d. zzz.yyy.xxx.edu. ->FQDN

2. Determine which of the following is an FQDN and which is a PQDN:

a. mil. ->FQDN

b. edu. ->FQDN

c. xxx.yyy.net->PQDN

d. zzz.yyy.xxx.edu->PQDN

3. Find the value of the flags field (in hexadecimal) for a query message requesting an address and demanding a recursive answer.

0000000100000000 = 0x0100

5. Analyze the flag 0x8F80.

0x8F80 = 1000111110000000

This is a response message from an authoritative server. The request was an inverse request with recursion desired and recursion was available. The message is truncated.

7. Is the size of a question record fixed?

The size of a question record is not fixed because query name field is variable in length.

9. What is the size of a question record containing the domain name fhda.edu?

Query name = 3 a t c 4 f h d a 3 e d u 0 = 14 bytes

Query type = 2 bytes

Query class = 2 bytes

Question Record = 14 + 2 + 2 = 18 bytes

11. What is the size of a resource record containing the domain name fhda.edu?

Assuming that the domain name field is a pointer, the record is 22 bytes in length.
